

# Hydroponic Chamber

Yu-Hsuan (Teddy) Chao

Lauren Grice

Jordan Weaver

# Background

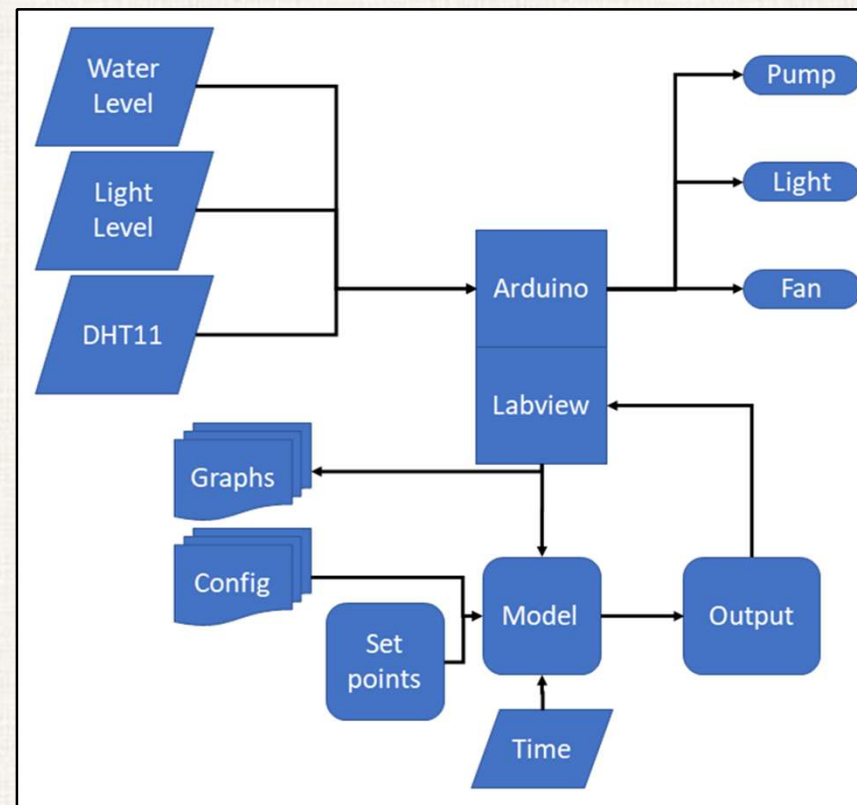

## Project: One Plant Hydroponic Chamber

- Maintain control of:
  - Water level
  - Light exposure
  - Temperature
  - Relative humidity
- Seeks to address problems with current hydroponics

# Flow Chart

# Goals

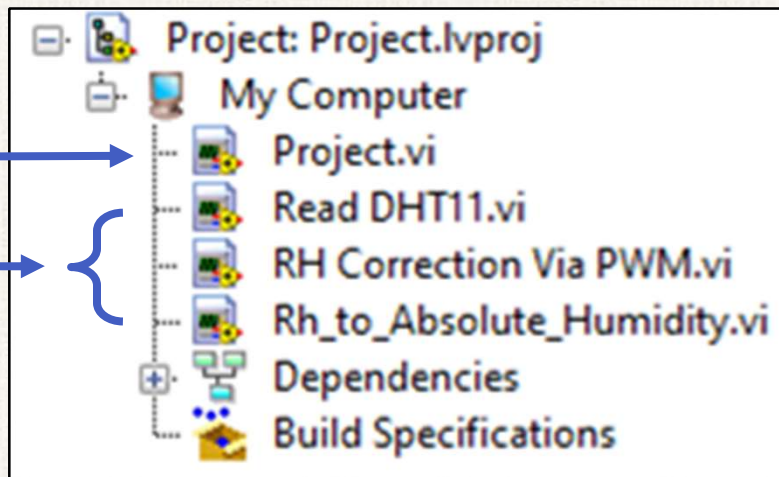

Initial Goal	Achievement Status
Maintain Water Level	50% - Needs relay, pump, reservoir, & piping
<b>Maintain Temperature</b>	<b>100%</b>
<b>Maintain Humidity</b>	<b>100%</b>
Maintain Light	75% - Needs relay and grow light
Operate Continuously without PC	0% - Would require laptop running LabView full time
<b>Implement DHT11 + Custom Firmware</b>	<b>100%</b>
<b>3D Print Something</b>	<b>100% - Motor mounting bracket</b>

# VI Breakdown

Main VI

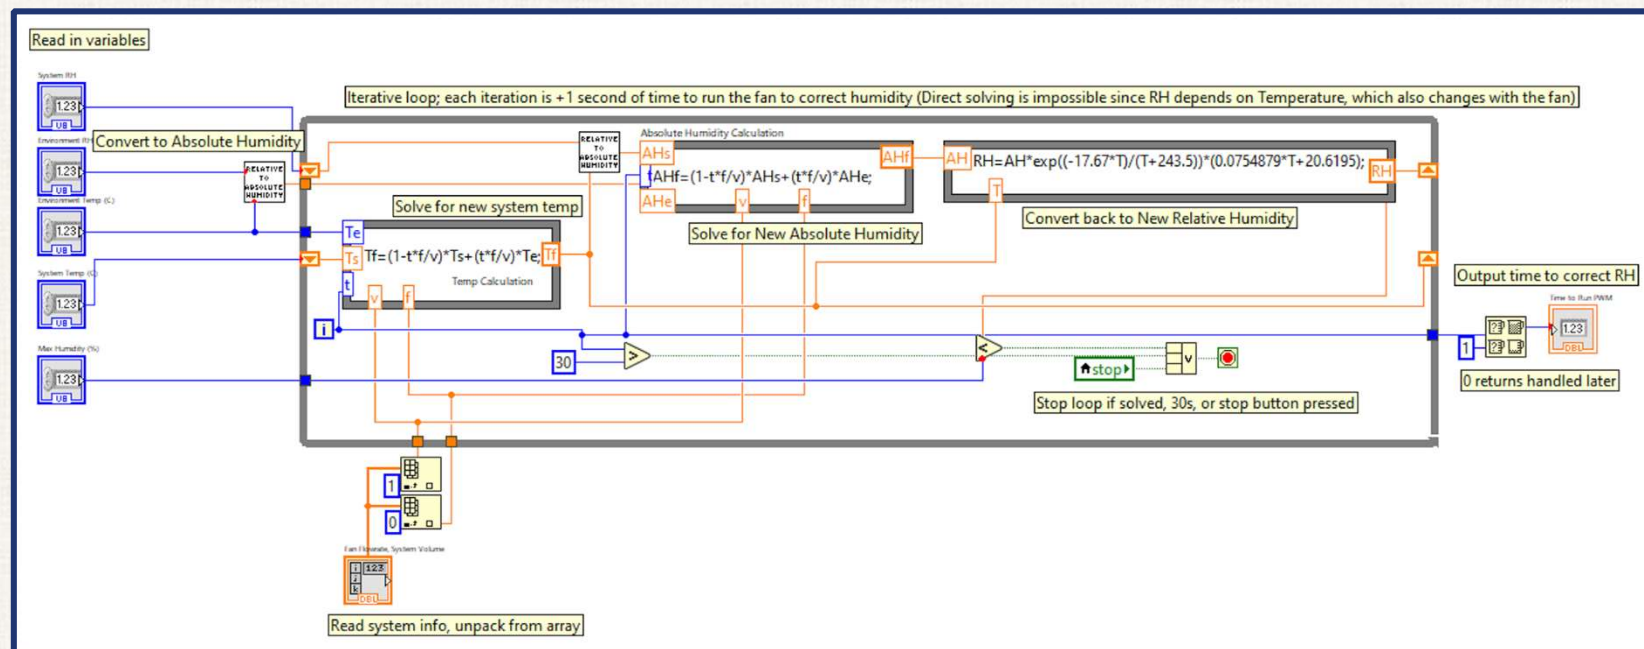

Sub-VIs

**Sub VIs**

# RH Correction Via PWM

## Inputs:

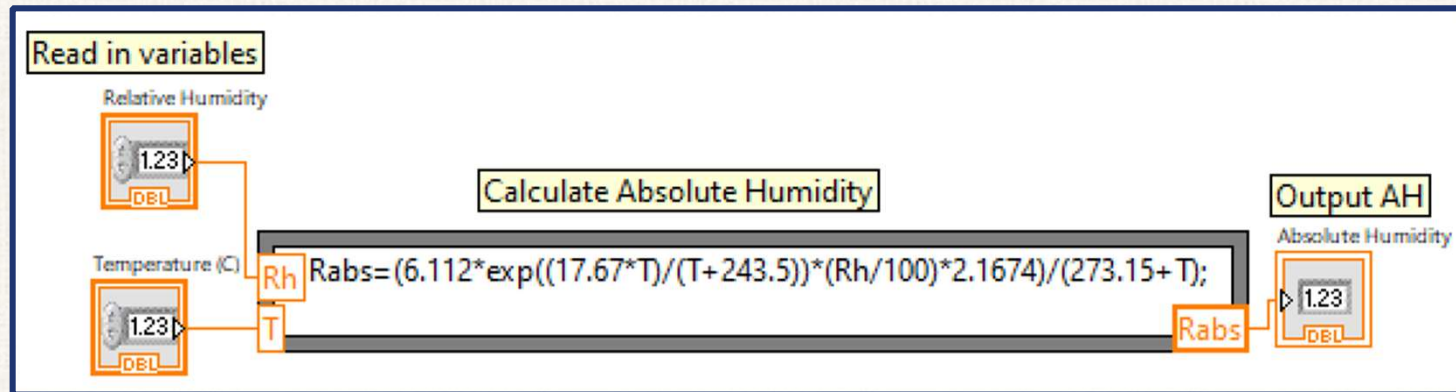

1. System's and environment's relative humidity & temp.
2. Maximum allowed RH

## Output:

Number of seconds to run fan

# RH to Absolute Humidity

## Inputs:

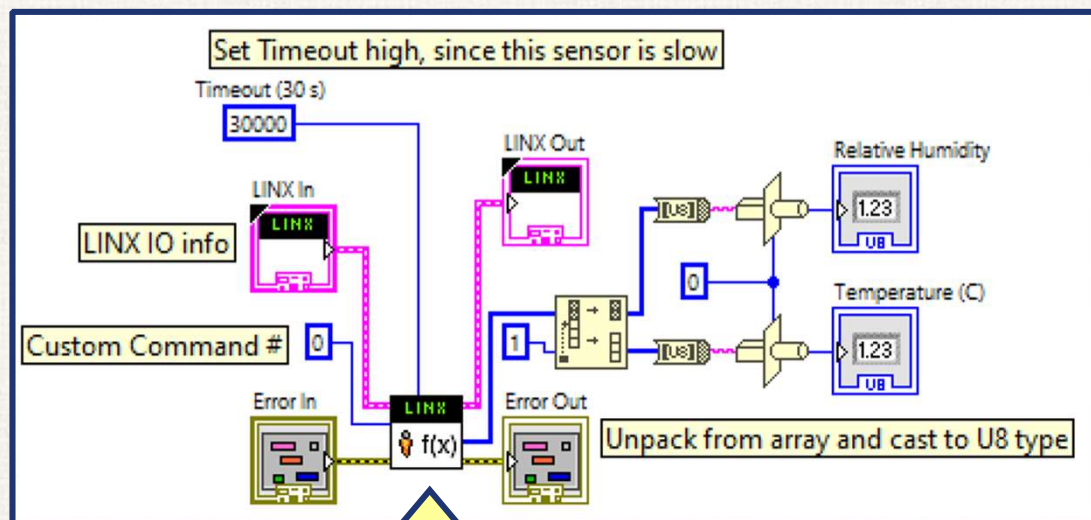

1. Chamber temperature (C)
2. Chamber relative humidity (%)

## Output:

Absolute humidity

# DHT11

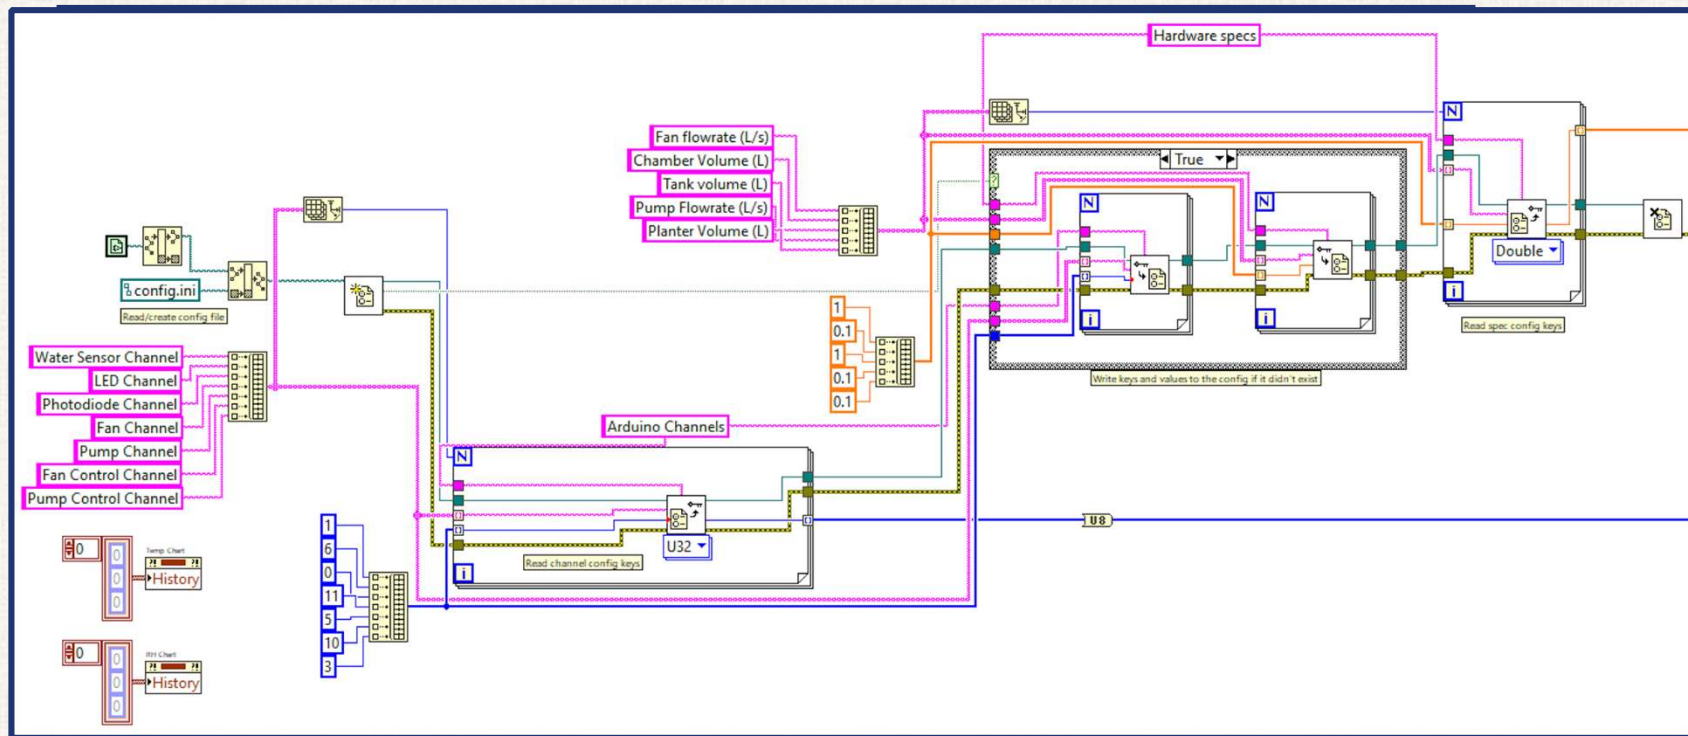

DHT11 Hardware

Custom LINX Command

- Requires custom firmware on the Arduino
- Call a LINX custom command from Labview

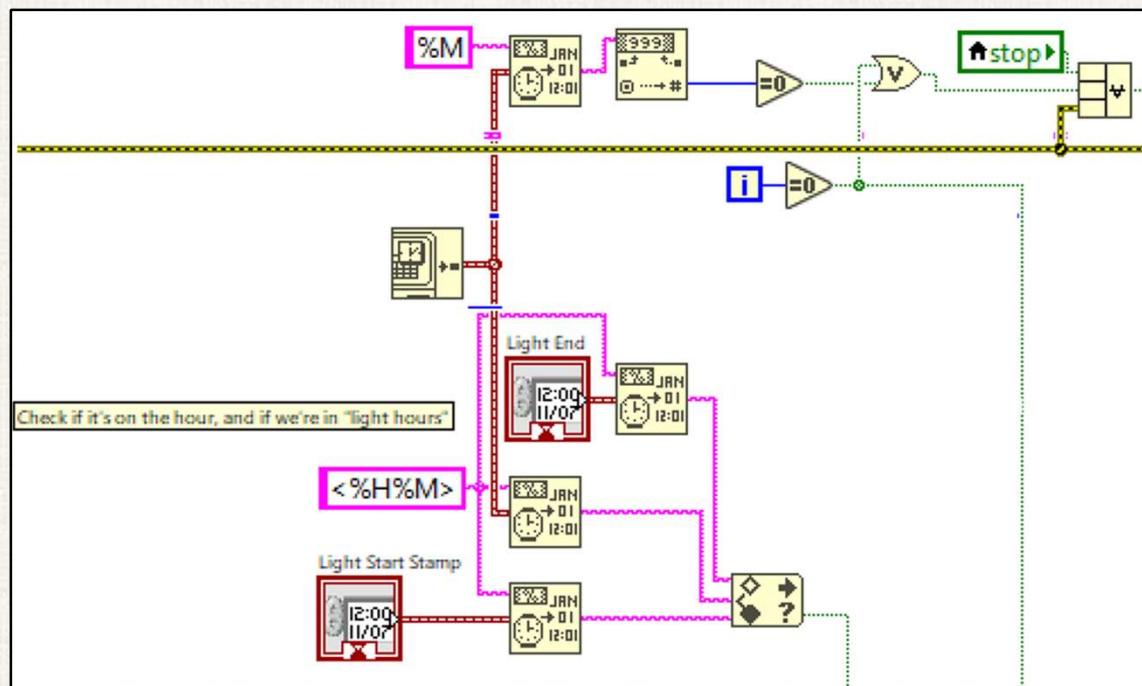

# Main VI Elements

# Configuration File Use

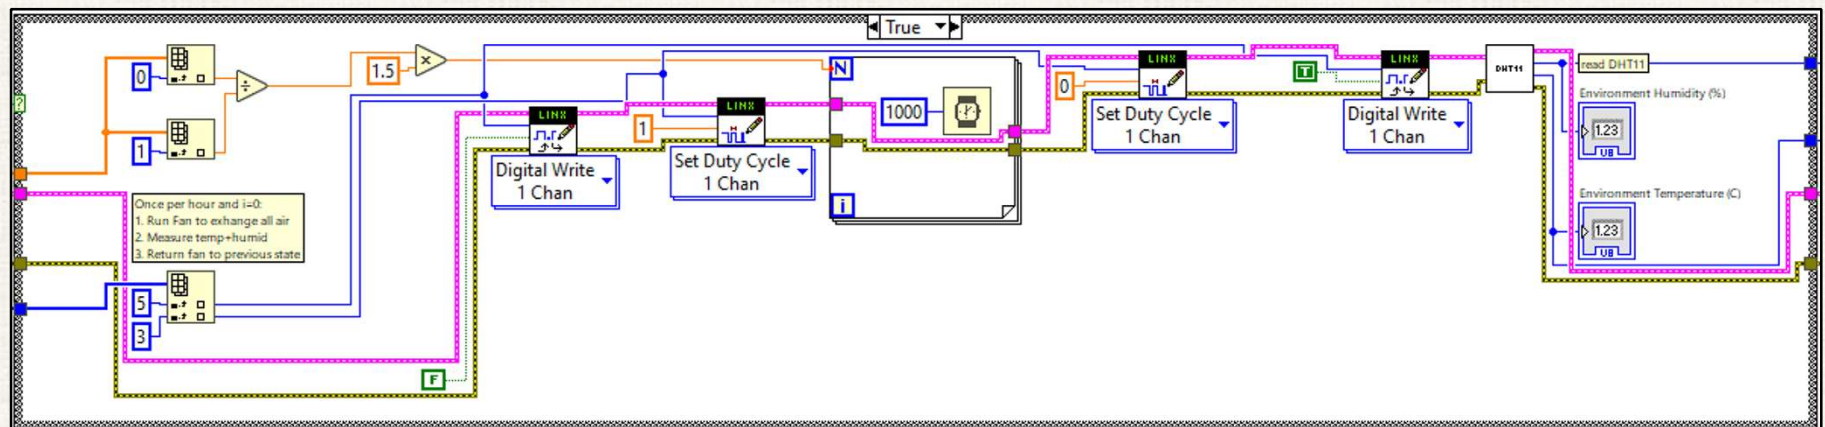

Configuration File Reading, Creation, Writing, and Chart Clearing

# Control of Grow Light

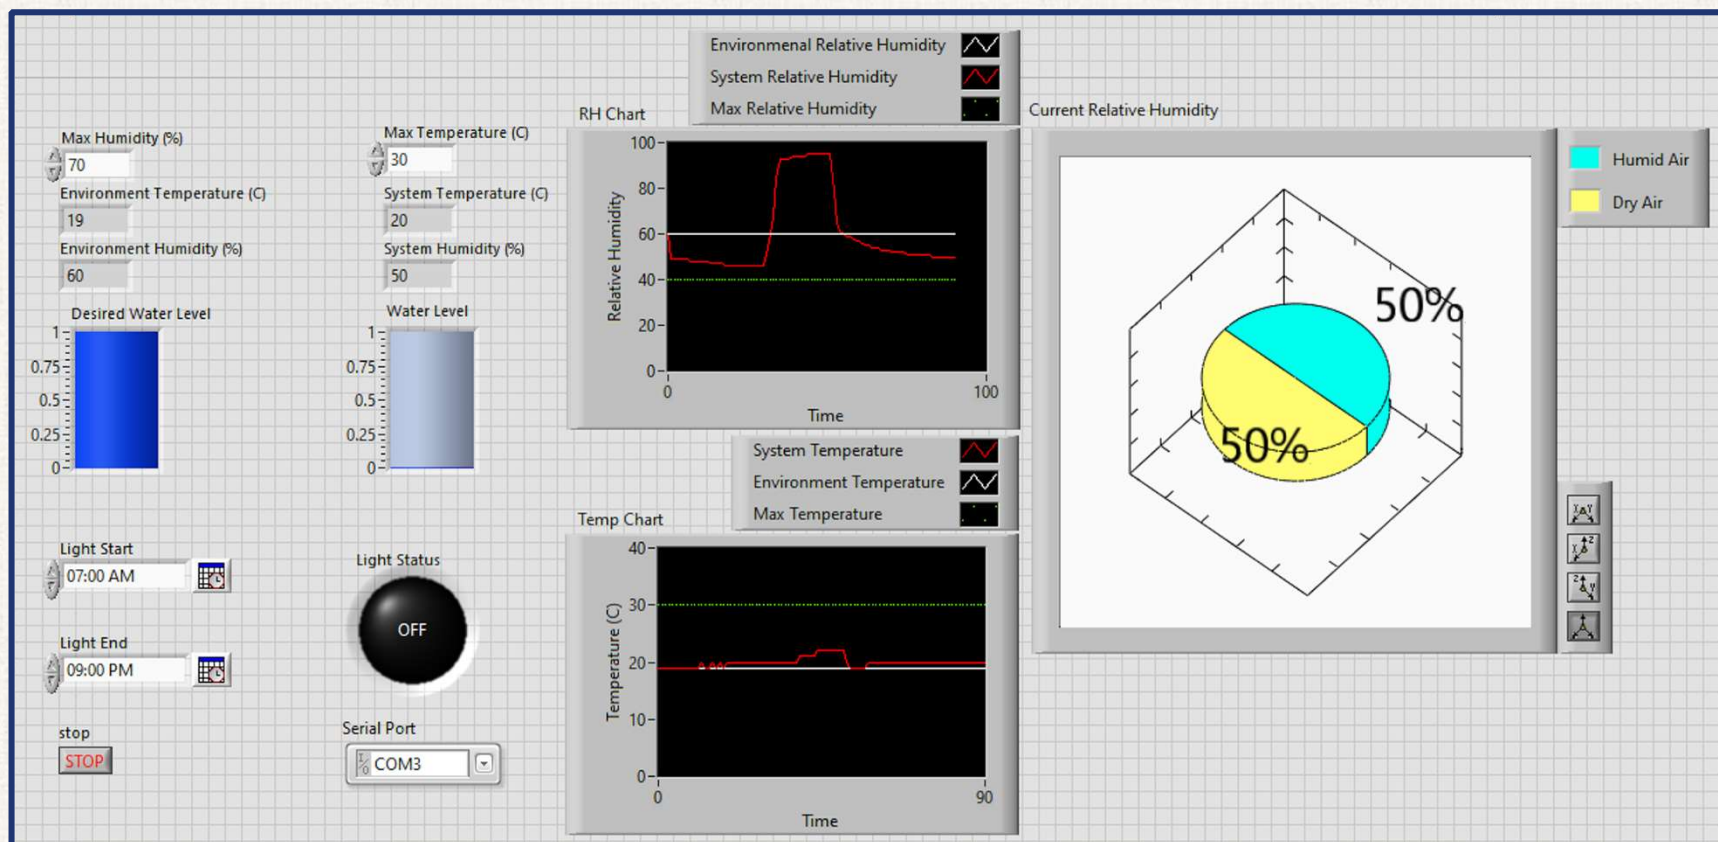

Checking for iteration 0 on the hour and within light hours

Hourly and Iteration 0 air exchange and DHT11 reading

# Results: User Interface

# Results: Final system

# Testing Results

- Limitations:
  - Lacking water
  - Proximity to window
- Grow light and indicator worked as designed
- DHT11 sensor worked... but fan function was not ideal

# Future work

---

- Use a relay and line-level voltage to control a real Grow Light (400 W+)
- Add a relay, power supply, water pump, and external water reservoir
- Use a better Fan (3D printed replacement possible)
- Calibrate photodiode based on light exposure from actual sunlight
- Add pH, Total Dissolved Solids (TDS) meters and correction methods
- Make code to Arduino-only, or implement remote Labview connection
- Permanently wire and enclose the system
